

'It would be hard to imagine a better or more important book'

Bill Bryson

'If you are not already addicted to Tim Flannery's writing,
discover him now' Jared Diamond

Acclaimed naturalist, conservationist, philosopher and adventurer
Tim Flannery has explored every corner of the globe – from the
tropical heat of the rainforests to the exquisite beauty of Australia's
coral reefs, from the snows of Kilimanjaro to the melting ice sheets
of the Antarctic – to discover how the earth's climate has changed
over millennia, and how we are now changing it ourselves.

Whether looking at the demise of the polar bear or the warming of
the oceans, this moving and inspiring book shows how the slightest
imbalance now has the power to shape our future and that of the
entire world – and what we can do about it.

'A magnificent book; exciting, poetic, passionate'

Redmond O'Hanlon

'A hymn to life ... Flannery's climatic epic on the erosion of life
on Earth is an epitaph and a cause for hope' Richard Mabey

'Shocking ... straight-talking ... refreshingly different' *Guardian*

'The *Silent Spring* of climate change' *Nature*
